

Independent RQ2 Human Audit — Auditor Protocol Excerpt

Audience: external independent auditor

Scope: classification of 121 blinded post-verification Missing candidates

Blinding: this excerpt deliberately omits prior labels and aggregate results

Purpose

Provide an independent human classification of each candidate event for the RQ2 estimand: whether a first post-verification Missing observation reflects **genuine post-verification decay** (physical disappearance / irreversible loss of the referenced artifact after prior verified existence), or an alternative explanation under the study taxonomy.

Units

One row = one candidate event, identified by opaque `event_id`.

Required judgments (per event)

1. Primary taxonomy category (see codebook).
2. Binary estimand: genuine post-verification decay? YES / NO / INSUFFICIENT_EVIDENCE
3. Confidence: High / Medium / Low
4. Short evidence note (2–3 sentences).
5. Ambiguity flag / competing categories if needed.

Evidence allowed

- Fields in the blinded CSV / XLSX form
- Public repository content at the listed URLs and commits
- Tree / history / manifest inspection you perform yourself

Evidence forbidden during annotation

- Prior auditor labels or withheld label files
- Aggregate study numerators or study narrative
- Any file not shipped in this package except public repository contents

Deliverable

`rq2_second_auditor_labels.csv` covering all 121 `event_id` values exactly once.

After return

The study team will compare your labels to the frozen first-auditor labels **after** your CSV is received. Those comparison steps are out of scope for this package.
